

1.2 Purpose of the Project

The main purpose of this project is to use Tableau to make heart disease data easier to understand. Heart disease is a thing that is affected by lots of factors like how old you are your blood pressure, cholesterol levels ECG results and the way you live your life. This makes it hard to look at the data by hand.

Tableau dashboards and charts can show this information in a way that's easy to get. The project helps doctors and nurses find patients who're, at high risk of getting very sick at an early stage so they can get treatment on time and not get too sick. It also helps hospitals plan what they need to do and how to take care of patients by showing them what is going on with patients and what kinds of diseases they have.

The project shows how important it is to make data look nice and easy to understand in healthcare. It takes the data and turns it into something that makes sense without needing to know how to program well.

The project is using Tableau to make heart disease data easier to understand. It is helping healthcare professionals make better decisions. Tableau is a part of this project, and it is making a big difference. Overall, it is helping healthcare providers make decisions based on data, which is improving the way they take care of patients plan their treatment and get results. Heart disease data is very important. Tableau is helping to make it more useful.
