2.2 – Empathy Map Canvas

This Empathy Map Canvas represents the journey of a heart disease patient and helps us understand their experiences, emotions, challenges, and expectations. By looking at the patient's perspective, healthcare providers can deliver better care and make more informed decisions.

- Says:** The patient wants to understand their risk of heart disease and seeks clear, reliable health information.

Heart Disease Analysis using Tableau

- **Thinks:** They often think about their current health condition and how they can prevent future heart-related problems.
- **Feels:** The patient may feel worried, stressed, or anxious about their health, but also hopeful about recovery and a healthier future.
- **Does:** They visit doctors regularly, take prescribed medications, follow healthy lifestyle habits, and monitor their health indicators.
- **Pains:** The patient faces difficulties such as understanding medical reports, managing treatment costs, and dealing with the fear of serious complications.
- **Gains:** They want early diagnosis, effective treatment, easy-to-understand insights, and a better quality of life.

The canvas also highlights the perspective of healthcare providers, who focus on accurate patient data, early detection of heart disease, and providing the best possible treatment.

Using Tableau, healthcare data can be transformed into interactive dashboards and visual reports. These visualizations help identify risk factors, monitor patient health, and support faster, data-driven healthcare decisions.
