2.3 – Brainstorming

The first step in the Heart Disease Analysis project is brainstorming. This is where we collect ideas to understand the problem and plan how to analyze it. Heart disease is a problem worldwide. It is one of the reasons people die. So, it is very important to find out what causes it. We can use Tableau to look at healthcare data and get information to help us make good decisions and prevent heart disease.

The main goal of this project is to look at the things that are related to heart disease and find patterns in patients. When we brainstorm, we think about questions like: What age groups are most affected by heart disease? Does being a man or a woman make a difference? How do things like smoking, drinking alcohol. Exercising affects our health? Is there a connection between heart disease and other health problems like diabetes and stroke?

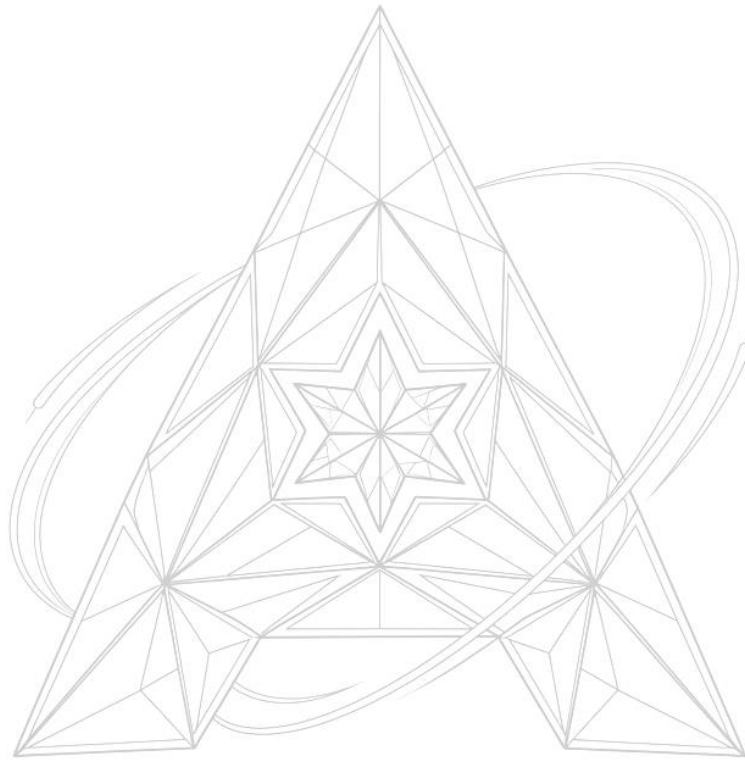

To answer these questions, we look at information in the dataset. This includes things like how old someone's if they are a man or a woman what race they are, their weight if they smoke, if they drink alcohol, how much they exercise how healthy they are if they have diabetes if they have had a stroke and if they have heart disease. These things help us understand who is at risk and why.

We plan to make pictures with the data to show it in a way that's easy to understand. We can use bar charts to show how many men and women have heart disease and how it affects age groups. We can use bar charts to show how smoking and drinking alcohol affect our hearts. We can use scatter plots to show how age and weight are related. We can use heat maps to show how diabetes, stroke and heart disease are connected. These pictures help us see patterns and trends quickly.

Finally, we put all the pictures together in a Tableau dashboard. This dashboard lets users look at the data in ways and get useful information about what puts people at risk for heart disease. The brainstorming phase helps us figure out what we want to do and

Heart Disease Analysis using Tableau

what information we need. How to show it. This gives us a foundation for our Heart Disease Analysis project using Tableau.
