

Heart Disease Analysis using Tableau

TEAM ID	SWTID-2026-8531
PROJECT TITLE	Heart Disease Analysis using Tableau
MAX MARKS	2 MARKS

3.2 – Solution Requirement

We are going to use Tableau to analyze heart disease data. This will help turn patient records into easy-to-understand visuals.

The system will. Process healthcare data and then create visualizations. This will help healthcare professionals find risk factors to track conditions and make better decisions. The solution will combine information like age, gender, blood pressure and cholesterol levels into a platform.

This platform will have dashboards that show disease trends, patient demographics and how different health factors relate to heart disease.

- Interactive tools like filters, charts and graphs will let users explore data in ways.
- They can quickly find patients who're at high risk.
- The solution will help healthcare professionals see patterns in records.

They can compare disease rates across categories. See how different risk factors impact heart disease.

By providing real-time visuals and reports the system will make it easier to understand data. It will reduce the work needed for analysis.

The insights from Tableau will help identify risks, plan treatments, monitor patients and prevent health issues. Overall, the solution will give healthcare organizations a user- data-driven approach, for heart disease analysis.

This will help them make decisions, improve patient outcomes and provide better healthcare services with heart disease data, and analyze heart disease using Tableau.
