

Heart Disease Analysis using Tableau

TEAM ID	SWTID-2026-8531
PROJECT TITLE	Heart Disease Analysis using Tableau
MAX MARKS	5 MARKS

CHAPTER – IV PROJECT DESIGN

4.1 – Problem Solution Fit

The Problem with Heart Disease

- Heart disease is a cause of death all over the world.
- We have a lot of data, but it is hard to look at it all by hand.
- Doctors and nurses have time to find the important things that can cause heart disease.
- The old way of making reports does not give us a picture of what is going on.
- We need a way to look at and understand the data about heart disease.

How Tableau Helps with Heart Disease

- Tableau takes raw patient data. Turns it into pictures and graphs that we can use.
- These pictures and graphs which we call dashboards show us what is happening with heart disease and what things can cause it.
- By looking at the data, we can find the people who're most likely to get heart disease.
- We can also use filters to look at the data in ways.
- The reports that Tableau make are easy to understand so doctors and nurses can make decisions about how to take care of their patients.

How Tableau Solves the Problem of Heart Disease

The Heart Disease Analysis using Tableau project helps us deal with the problem of having a lot of healthcare data by giving us interactive pictures and graphs. Tableau makes it easier for us to understand the data, find patterns and see what things can cause heart disease. This helps doctors and nurses make decisions about how to take care of their patients and prevent heart disease.
