4.2 – Proposed Solution

The idea is to build a **“Heart Disease Analysis System using Tableau”**. This will help doctors analyze data and understand what causes heart disease. The system will use charts and graphs to make complex data easy to understand.

The solution starts with collecting data on heart disease from sources. This includes details, medical history, blood pressure, cholesterol levels and other health information. The data is then. Organized to ensure it is accurate.

“Tableau” is used to create charts and graphs. This allows users to explore the data in ways. Various charts, graphs and dashboards are designed to identify patterns and relationships among risk factors. These help doctors understand how factors such as age, gender, cholesterol and lifestyle habits affect heart disease.

The system has a dashboard. Users can. Compare patient information based on different criteria. This helps doctors identify high-risk patients, monitor disease patterns and evaluate the impact of risk factors. **“Tableau Stories”** are also created to present the analysis and findings in a way.

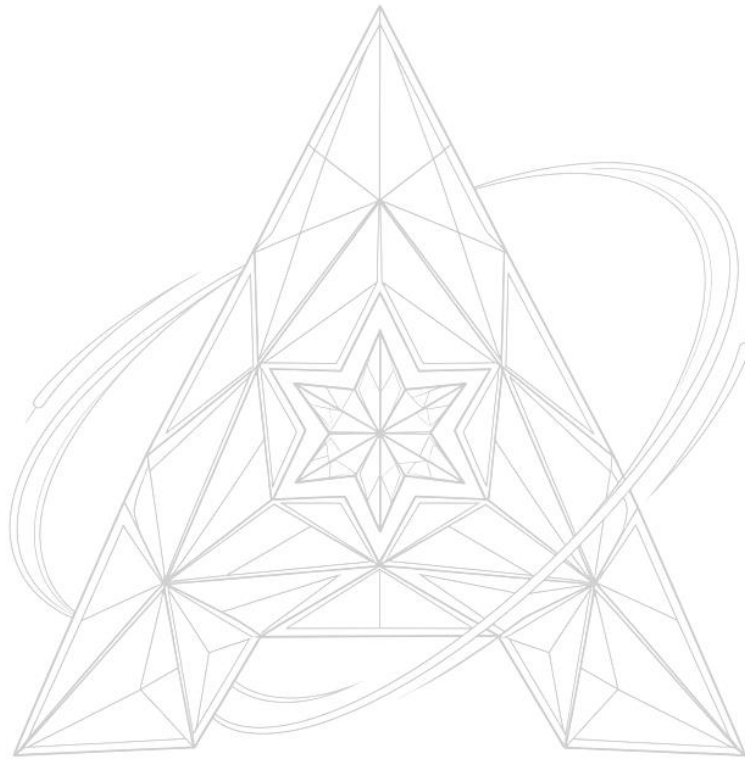

To make it accessible the dashboards are published on **“Tableau Public”**. Integrated into a web application built with **“Flask”**. This allows users to access the reports through a web interface and interact with the dashboards from anywhere.

The proposed solution offers benefits. These include data analysis, better visualization of healthcare information and improved decision-making. By reducing the complexity of data interpretation, the system helps doctors make informed decisions regarding diagnosis, treatment planning, patient monitoring and preventive healthcare measures.

Overall, the **“Heart Disease Analysis using Tableau”** solution provides a efficient and user-friendly platform, for healthcare data analysis. It supports data-driven decision-

Heart Disease Analysis using Tableau

making. Contributes to improved patient care, early risk detection and effective heart disease prevention strategies.
