

9.2 – Disadvantages

- a. **Data Quality Matters:** If patient records are wrong or outdated the results will be wrong too. We will get the wrong idea about what is going on.
- b. **It Is Not Good at Predicting Things:** Tableau is mainly used to make pictures with data and write reports it is not good at making predictions like some tools.
- c. **It Can Be Expensive:** The full version of Tableau costs a lot of money, which's a problem for students, small hospitals and people who do research.
- d. **You Need to Learn How to Use It:** To make dashboards and use all the features you need to learn how to use Tableau and that takes time. We Need To
- e. **Keep Data Safe:** The data we use to analyze heart disease has a lot of information, so we need to make sure it is safe and secure.
- f. **It Can Be Slow with Big Data:** If we are working with a lot of data Tableau can be slow which makes it hard to get things done.
- g. **It Does Not Help with Cleaning Data:** We usually need to clean up the data before we can use it in Tableau and that can be a lot of work.
- h. **We Need to Update Data All the Time:** To make sure we have the information we need to update the data all the time and that can be a challenge.
- i. **It Is Easy to Get the Wrong Idea:** If the pictures we make with the data are not clear or if we do not understand how the data is related, we can get the idea about what is going on.
- j. **We Need the Internet to Use It:** To use Tableau and share it with others we need to be connected to the internet. That can be a problem sometimes.
- k. **It Is Not Good at Statistics:** Tableau can do some analysis, but it is not as good as some other tools that are just for statistics.
- l. **It Is Hard to Connect Different Data:** It can be hard to connect all the sources of data and make sure they all work together.
